Policy compliance audit (2026-11-01, version 1.1.0; 1.0.0 audit below still holds)

Engineering checklist against Google Play Developer Policy, Play Billing policy, AdMob program policies and Android platform rules, checked on the release bundle, the live website and the automated tests. **Pass** = verified; **Owner** = a Play Console / AdMob action (steps in `docs/FINAL_RELEASE_STEPS.md`). This is an engineering review, not legal advice.

What 1.1.0 changes (re-checked)

Area	Change	Status
Store listing / name	App renamed "Stone Storm" (launcher label, title card, store graphics, website). Package id unchanged, so it is an update, saves and purchases stay	Pass; owner renames the listing (`RELEASE_1_1_0.md` Step 1)
Feature showcase	Home card about features (Remove Ads, addons, skins, crates, upgrades, engines, missions). No prices, timers or "only today"; never mid-level; skips owned items; max 4 a day; X and Later close it	Pass (Play: no deceptive or misleading monetisation; AdMob: it is not an ad)
Analytics	New events `promo_shown`, `promo_tap` (card id only). Whitelisted; privacy policy section 4 updated and deployed	Pass
Play Games Services v2	Automatic sign-in, Settings button. Only the display name is kept, in memory. No new permission	Pass; owner adds the app signing SHA-1 and publishes PGS (`RELEASE_1_1_0.md` Step 1)
Billing sheet orientation	Proxy activities now `behind` (follow the game), so both landscape directions work and Android 8.0 doesn't crash	Pass
Notifications	Same rules. Debug-only "Test reminders" button is compiled out of release builds (`OS.is_debug_build()`)	Pass
Energy	10 bars, empty to full 30 min, refills from the wall clock while closed. Free, no paid-only refill	Pass
Campaign end	Says new levels are coming; no date promised, nothing sold	Pass

| Website | Moved to `stonestorm.pages.dev` (site, privacy, app-ads.txt live). Old `castle-smashers.pages.dev` kept online for 1.0.0 | Pass; owner updates the Website and Privacy policy fields | | Energy reminder | "Energy full" notification checked on the test phone (2026-11-02), plus the other reminder kinds | Pass |

Play Console messages seen on 1.0.0 (no action needed)

- "No deobfuscation file": the game doesn't use R8/ProGuard, so there is nothing to upload.
- "Native code without debug symbols": optional; Crashlytics NDK already symbolises our crashes well enough, and Godot's engine symbols would add about 400 MB per upload.
- 11 unsupported devices (6 car head units, 3 kiosk/payment terminals, 2 rugged handhelds): they lack a required feature (touchscreen/OpenGL ES 3 or are cars, which need Android Auto approval). Not phones players use; no change.

Google Play Billing / Payments

Rule	Status	Evidence
Digital goods sold only through Play Billing	Pass	All 11 products (`balance.shop.order`) go through `Store` → Billing Library 9.1.0
Product IDs match Play Console	Pass	coin_crate, gem_crate, hellfire_crate, remove_ads, addon_pirate_hat, addon_cap, addon_crown, addon_viking, addon_top_hat, addon_shades, addon_specs (owner created all 11, purchase option `buy`)
Purchases acknowledged/consumed within 3 days	Pass	Consumed / acknowledged right after the reward is saved; unfinished ones retried at every launch and resume
Rewards only for PURCHASED; pending handled	Pass	`PurchaseProcessor.process`; tests "pending grants nothing", "pending → purchased grants once"
No double grant, crash recovery	Pass	Token ledger in the save, written before consume; restart test
Non-consumables restorable, refunds revoked	Pass	`query_purchases` at start and on resume, Restore button; refunded addons / Remove Ads are removed
Prices are Play's localized prices	Pass	`Store.price_text` from Play; products created after install are re-queried when the shop opens
Loot boxes	Pass (n/a)	Crates have fixed, displayed contents
Payment sheet doesn't rotate the game	Pass	`ProxyBillingActivity` / `V2` set to `behind` (they follow the game's `sensorLandscape`; a fixed value crashes Android 8.0) (checked in the bundle by `release.py verify`)
No secrets in the client	Pass	No service-account keys in the repo or bundle

AdMob / Ads policy

Rule	Status	Evidence
Real App ID and ad units in the release build	Pass	`ca-app-pub-1292430265619610~9195063737`, units `/6882407348` (interstitial) and `/1846749261` (rewarded), checked inside the bundle; debug builds use Google test units
Consent (UMP 4.0.0) before ads; can be changed	Pass	Requested before the first load; Settings → Ad Privacy where required. GDPR + US messages published in AdMob
app-ads.txt	Pass	`https://stonestorm.pages.dev/app-ads.txt` = `google.com, pub-1292430265619610, DIRECT, f08c47fec0942fa0`. Owner: website field in the store listing must be `https://stonestorm.pages.dev`
Ad content rating	Pass	Max rating T in code and AdMob; audience 13+
Rewarded ads opt-in, reward named	Pass	"WATCH AD: …" buttons only

Rule	Status	Evidence
Interstitials only at natural breaks	Pass	Only after the player taps Next/Retry/Map/Restart; 1 per 4 matches, ≥ 60 s apart, none before level 3, never during play or on app open
No accidental clicks	Pass	No banners; full-screen ads use their own close button
Remove Ads removes every ad	Pass	`Ads.ads_removed()` blocks every format
Link the app in AdMob after it is live	Owner	AdMob → Apps → App settings → Add app store details

Privacy and data

Rule	Status	Evidence
Privacy policy in app and listing	Pass	`https://stonestorm.pages.dev/privacy/` (live, updated 2026-11-01: new events, rating/update prompts, backup). Settings → Privacy opens it
Analytics without personal data, user can turn off	Pass	Whitelist `Analytics.EVENTS` (unknown events dropped, tested); Settings → Analytics switch
Support contact	Pass	Settings → Contact Support (email); same email in the listing and policy
Backup	Pass	Only `save.json` + `save.json.bak` (`cs_data_rules.xml`); ad/Firebase IDs never restored
Data safety form	Owner	Answers in `FIREBASE_SETUP.md`; no new data types this release
Advertising ID declaration	Owner	AD_ID permission present → answer Yes (advertising + analytics)
Account deletion	Pass (n/a)	The game has no accounts

Ratings and updates (Play In-App Review / In-App Updates)

Rule	Status	Evidence
Review prompt not incentivised or pre-filtered	Pass	No reward, no "do you like it?" question first; Google's own card after a 3-star win from level 8, max 3 asks, 30 days apart
Updates use Play's own flow	Pass	`CastlePlay.startUpdate`; immediate only for release priority ≥ 4

Families / target audience

Rule	Status	Notes
Not directed at children	Decided	Target audience **13+**. Under-13 groups would require the Families policy (child-directed ad settings, different analytics)
Content rating	Owner	IARC: cartoon/fantasy violence, in-app purchases, ads; no user interaction, no location sharing

Notifications (Android 13+, Play spam policy)

Rule	Status	Evidence
POST_NOTIFICATIONS asked at runtime	Pass	About 1 s after the first home screen (Android never asks at install); fallback after a won level
Not spammy or misleading	Pass	Max 1 reminder a day, quiet hours 22:00–09:00, real triggers only (energy full, spin, daily reward, chest, special levels, update, 2/5/10 days away), no purchase pushes, Settings switch
No exact alarms	Pass	Inexact `AlarmManager.set`; no `SCHEDULE_EXACT_ALARM`

Permissions in the bundle (all granted at install except notifications)

INTERNET, ACCESS_NETWORK_STATE, VIBRATE, WAKE_LOCK, POST_NOTIFICATIONS (runtime), BILLING, AD_ID + ACCESS_ADSERVICES_AD_ID / ATTRIBUTION (AdMob), c2dm RECEIVE (push), install referrer, READ_BASIC_PHONE_STATE (normal permission added by a Google library, no prompt) and plain FOREGROUND_SERVICE (from Google's WorkManager library; the game declares no foreground-service type, so no foreground-service declaration applies). No location, camera, contacts, storage or SMS.

Technical requirements

Rule	Status	Evidence
Target API	Pass	targetSdk 36 (Android 16), minSdk 24
64-bit	Pass	arm64-v8a + armeabi-v7a
16 KB page size	Pass	Every 64-bit native library in the bundle has 16 KB (0x4000) LOAD alignment (checked 2026-11-01). The 32-bit libraries are 4 KB, which is allowed (the rule is for 64-bit)
App Bundle, signed with the upload key	Pass	`release.py verify`: signer CN=Intercore matches `~/castle_upload.keystore`; Play App Signing re-signs
Size	Pass	About 133 MB, under the 200 MB limit
Automated tests	Pass	Full suite 0 failures (1.1.0: 1 704 lines of PASS output), `contraptions` (31) and `specials` (44)
Closed test, 12 testers for 14 days	Owner	`FINAL_RELEASE_STEPS.md` step 4

Known risk

Levels 51–75 (1.1.0) were each won by the headless search bot (`record_trailer.py --search` and a wider beam search), most needing 3 or all 4 heroes; 62, 73 and 75 were re-tuned until they could be won. Human players will find other lines. Watch `level_failed` per `level_id` in Analytics after release.

Levels 6, 32–36 and 42–48 were made harder on 2026-10-31. The automated tests check that they load, stay stable and that their set-pieces work, but nobody has beaten every one of them yet. Ask closed testers to report any level they can't beat.
