Stone Storm 1.1.0: release the 75-level update

Where we are: 1.0.0 (code 9, still named Castle Smashers) is uploaded to Play **closed testing** and the testers are already added. 1.1.0 (code 10) is the rebuilt Stone Storm version. It goes to the **same closed testing track** as an update: testers get it automatically over 1.0.0 and keep their progress, coins and purchases (same package `com.castlesmashers.game`). 1.1.0 is then the build you send to production. 1.0.0 never goes to production.

Uploading a new release to the same track does **not** restart the 14-day closed-test clock; it counts the days your 12+ testers stayed opted in.

The files (never mix them up)

File	What it is
`Documents/Castle Smashers Releases/castle_smashers_1.0.0_code9.aab`	1.0.0, kept read-only. Your fallback. Never re-upload it after 1.1.0 (Play refuses lower codes).
`build/castle_smashers.aab`	Same 1.0.0 bundle. The new builds never write to it.
`build/stone_storm.aab` + copy `Documents/Castle Smashers Releases/stone_storm_1.1.0_code10.aab`	**1.1.0, the one to upload.** Real ads, real billing.
`build/stone_storm_debug.apk`	For friends who are not testers: Google test ads, purchases don't work. Can't be installed over the Play version (different signature): they uninstall it first.

What changed for players

- 75 levels: 25 new ones in the Scarlet Highlands, Storm Crags and Iron Citadel, all hard or very hard, with new contraptions (magnets, portals, gravity, bumpers, repair crystals, floods...).
- Rotating level challenges on the Achievements screen.
- "All realms conquered" screen after level 75: new levels are coming.
- Feature showcase on the home screen (Remove Ads, Addons, Skins, Crates, Workshop...).
- Army energy: 10 bars instead of 5, empty to full in 30 minutes, with a reminder when it is full.
- Google Play Games sign-in (automatic).
- New name and title screen: **Stone Storm**.
- Fixes: shop scrolling, payment screen no longer turns the game to portrait, calmer home screen, no more crackle in the studio intro.

Step 1. Play Console changes that come with 1.1.0 (10 minutes)

1. **App name**: Play Console → your app → **Grow users** → **Store presence** → **Main store listing** → **App name**: `Stone Storm` (or `Stone Storm: Castle Siege`, max 30 characters). Save. Search Play for "Stone Storm" first: if another game has exactly that name, use the longer one.
2. Same page: **Short** and **Full description**: copy from `store_listing/listing.md` (now says 75 levels in eight realms). **Feature graphic**: `store_listing/feature_graphic_1024x500.png`. **Phone screenshots**: the files in `store_listing/screenshots_designed/` (they show the new name). Save.

3. **Play Games Services**: follow `docs/PLAY_GAMES_SETUP.md` (every click, with the SHA-1 values). Short version: Play Console → **Grow users** → **Play Games Services** → **Setup and management** → **Configuration**. Check the credential for `com.castlesmashers.game` lists **both** SHA-1 fingerprints: the **upload key** and the **app signing key** (Play Console → Test and release → App integrity → App signing shows both). If only one is there, add an Android credential for the other. Without the app signing key, sign-in fails for everyone who installs from Play.
4. Leave Play Games Services **unpublished** until Step 3 shows sign-in works, then click **Publish** (Play Games Services → Publishing).
5. **Data safety**: no new data types. Play Games sign-in uses Google's own account screen; the game keeps only the display name in memory and sends nothing anywhere. Answers stay as in `FIREBASE_SETUP.md`.

Step 2. Upload 1.1.0 to the closed testing track (where 1.0.0 is)

1. Play Console → **Test and release** → **Testing** → **Closed testing** → open the track 1.0.0 is on → **Create new release**.
2. **Upload** → `build/stone_storm.aab`. Wait for the row **10 (1.1.0)**. 1.0.0 (code 9) moves to "not included" by itself; that's correct.
3. Release notes: `Castle Smashers is now Stone Storm! 75 levels, three new realms, new contraptions, level challenges, Play Games sign-in, more army energy and lots of fixes.`
4. **Next** → **Save and publish** (Google reviews it, usually a few hours to 2 days).
5. Testers don't need to do anything: Play updates them. Tell them in your tester group that the name changed to Stone Storm.

Step 3. Test on your phone (20 minutes)

Uninstall any test APK first, then install from the closed testing link (Play Store page). - The launcher name reads **Stone Storm**; the title card shows the new logo. - Google's "Signed in" banner appears (after `PLAY_GAMES_SETUP.md` is done). - Buy something cheap with your licence-tester account: the payment sheet stays **in landscape**. - Shop → Hero Addons scrolls. Home shows the DISCOVER MORE card once. - Energy shows **x/10**. Settings → reminders on; leave the game; the "energy full" reminder comes.

Step 4. Production

1. When the closed test has run 14 days with 12+ testers: **Dashboard** → **Apply for production**, answer the questions (what testers did, what you changed: "renamed to Stone Storm, 75 levels, fixes from tester feedback").
2. After Google approves: **Production** → **Create new release** → **Add from library** → **10 (1.1.0)** → rollout **20%** → after 2 days with no new crashes in Crashlytics, **100%**. Details for the launch week: `FINAL_RELEASE_STEPS.md` Steps 8 and 9 (same clicks, use code 10).

Step 5. After it is live

- AdMob and Firebase: rename the app to Stone Storm (cosmetic, nothing breaks if you don't).
- Website moved to `https://stonestorm.pages.dev` (live, with the privacy policy and `app-ads.txt`). The old `https://castle-smashers.pages.dev` stays online unchanged so 1.0.0 (which links to it) keeps working. In Play Console → Store settings → **Website**: `https://stonestorm.pages.dev`; App content → **Privacy policy**: `https://stonestorm.pages.dev/privacy/`. AdMob re-reads `app-ads.txt` from the new website within about a day (AdMob → Apps → app-ads.txt shows the status).
- Add a row to `docs/RELEASE_HISTORY.md` if you uploaded by hand.

If you need to go back

Halt the rollout (Production → Manage → Halt). You can't upload 1.0.0 (code 9) again; fix and build 1.1.1 (code 11) instead. Players on 1.1.0 keep their save either way.
